

# WIRELESS FIRE DETECTION

As buildings become more complex and fire safety requirements increase there needs to be a highly flexible solution which meets these demands.

## Fusion

is just that. Based on the award winning and highly successful FireCell platform Fusion is a hybrid solution providing almost unlimited configuration and installation options.

A FireCell Fusion hybrid system allows you to mix wireless and wired devices, 126 per loop, wired or virtual, using trusted EMS technology. Flexibility does not stop there, as a Radio Loop Module (RLM) can be installed onto the wired loop to provide up to 31 additional wireless devices to a specific location.

With up to 504 devices per panel and a wireless network capability providing a capacity of up to 4,032 devices, FireCell Fusion offers the most comprehensive route to fire safety.

FireCell Fusion uses EMS technology and software to assign wired and wireless devices throughout any building using SCT (Smart Cluster Technology).

An entire system can be installed to meet each building's specific risk assessment and special requirements, without compromise, whilst still fitting in with building users.

Add to this, reduced disruption to business, less disturbance and fast track installation and FireCell Fusion makes it your first choice,

## FireCell

was developed by EMS as the ultimate EN54-25 wireless fire detection system not just for today, but for all of tomorrow's applications. Using the FireCell platform EMS continues to develop new innovative ideas to ensure customers always have the best choice and solutions available.

A comprehensive range of wireless devices are available, all of which are completely self contained and self powered with dual supplies.

We provide comprehensive technical support including extensive training, bookable on-line, a technical support hotline, phone apps and video help files. This is backed up by the EMS industry beating warranty and lifetime product support
